Pipe Deployment Floats

A decorative graphic in the bottom-left corner consisting of a blue triangle with a black border, pointing towards the center.

Pipe Deployment Floats (Tie-in)

- ▶ Resinex Pipe Deployment Floats, the so-called “Tie-in”, are used in open sea to support the weight of pipes during the launch of a pipeline
- ▶ They optimize deployment procedures thanks to a concave shape which hugs the tube and limits its movement during the operation
- ▶ They are usually utilized from 10 to 200-300 m of depth, but if necessary higher depths can be reached

Pipe Deployment Floats (Tie-in)

- ▶ It is possible to combine the modules in order to obtain buoys with different buoyancies
- ▶ They can be fixed on pipes with different types of straps according to necessity: steel straps, steel and textile straps, special plastic straps
- ▶ Exact details on deployment procedures are studied together with the client, following his specific needs and requests

Example: Pipeline Deployment

This is an example of “S-Lay” method for pipeline deployment, where pipes are assembled on the vessel and then launched into the sea as the vessel moves forward.

The S-lay method can handle the full range of pipe sizes and it’s suitable for deployment both in shallow and intermediate waters.

It is characterized by a fast installation process.

Example: Pipeline Deployment

Resinex floats are fixed on pipe in order to reduce its bending before it touches the seabed: this is a key element that allows to avoid damages to the pipe coating.

A stinger placed at the stern helps to support the pipeline when it is launched.

Example: Pipeline Deployment

After the pipe has reached the sea bottom, Resinex floats are released from it, recovered by a support boat and then subsequently moved on the vessel to be reinstalled on another section of the pipe. In this way the floats can be reused several times until the operation is completed and can be stored for future installations too.

Quality Test

- ▶ Resinex Quality System is certified by Lloyd's Register Quality Assurance following ISO 9001 standards
- ▶ Each job follows a proper inspection and test plan
- ▶ A Resinex Certificate of Conformity is issued for each job
- ▶ Examples of in-house tests:

Hydrostatic pressure test

Net buoyancy test

Fit-up test

Fastening Removal Test (release of the hook)

Fastening Removal Test (cut)
